

VIRTUAL TECHNICAL CONFERENCE PLATFORM

SRN: PES1UG24CS551

Date: 28th Aug 2026

NAME: Abhay Dubey H

LAB-2 JIRA

1. Creating an EPIC and displaying Backlog – Anonymisation of Submitted Papers - FR-001.

2. Creating Stories with Story Points and Priority for the EPIC – Anonymisation of Submitted Papers - FR-001.

3. Creating an Active Sprint for the same EPIC from the Backlog.

4. Displaying Active Sprints.

5. Shifting Active Sprints to IN Progress(TO DO → IN PROGRESS).

ALL 3 in TO DO:

6. Shifting IN Progress to Done (IN PROGRESS → DONE).

ALL 3 in DONE:

7. Completing the Sprint.

8. BurnDown Chart, Graphical Representation:

9. BurnDown Chart, Analysis/Report:

Reflection Questions:

1. Did your estimations reflect the actual effort?

Answer:

Initial Estimations are closely reflected to actual effort.

5-point allocation for, automated metadata stripping accounted for backend file-parsing complexity – VTCP-2.

3-point allocation for, visual redaction – VTCP-3

2-point allocation for reviewer access controls – VTCP-4

Thus, the point values reflected theoretical effort and technical scope rather than real-time development hours.

2. Was your backlog well-prioritized?

Answer:

Yes, the Backlog followed a strict value and dependency order. Meta-Data stripping was ensured 1st to ensure integrity, followed by document layout, and access for the reviewer interface.

VTCP-2 (Metadata Stripping - 5 points), VTCP-3 (Visual Redaction - 3 points), VTCP-4 (Reviewer Access Controls - 2 points).

3. How did your simulated sprint align with your plan?

Answer:

The sprint achieved a 100% completion rate, moving all 3 work items through the TO DO → IN PROGRESS → DONE workflow to complete VTCP Sprint 1.

Execution closely matched the initial plan, completing all 10 story points within the sprint boundary. Tasks progressed smoothly through development and testing.

4. What insights did the burndown chart give about your team's capacity?

Answer:

BurnDown chart showed a steady, step-wise drop in remaining story points throughout the sprint, reflecting a proper distribution of work rather than a last minute call. It established a stable team capacity baseline of 10 points per sprint.

Instantaneous Burndown Cliff: The event log records all 3 issues dropping from remaining to completed between 2:25 PM and 2:29 PM. In Jira's graphical view, this produces a vertical drop early in the timeline rather than a steady diagonal slope toward the September 4 target guideline.

Workflow Logging Insight: For actual production cycles, logging progress incrementally across the sprint timeline will be essential to accurately track daily team velocity and capacity limits.
